

ComPsKiller 程序说明

ComPsKiller 是 Commercial Process Killer 的缩写，本软件使用了本人研制的商业级强制结束进程的代码，强度不算太强，但相比于市面上常见的驱动级结束进程的代码，其安全性和兼容性极高。本人估计，可支持 Windows Me 以及更新的操作系统。

本程序使用 Visual Basic 2010 编写，故运行本程序之前需要安装 .NET Framework 4.0 运行库。一般情况下，Windows 8 以及更新的操作系统自带 .NET Framework 4.0，而较旧的操作系统一般不自带该运行库，比如 Windows 7，Windows XP 等。值得注意的是，该运行库在 Windows Server 2003 里安装时需要先安装 Windows Image Component，未安装该组件会引起安装程序的安装失败。

本程序的驱动程序采用 Windows Driver Kit 7.1 进行编译。

本程序使用英文，但操作并不复杂。只需在文本框内输入进程的 PID，然后单击按钮即可。

Instruction for ComPsKiller

ComPsKiller is the abbreviation word for “Commercial Process Killer”. During programming, I used the commercial code which could terminate processes mandatorily. Its strength may be not so expectedly strong, but, in comparison to the common driver-level code that could terminate processes, its safety and compatibility is extremely outstanding. In my estimation, I bet that this program could run on Windows Me and upper operating system.

This program is written via Visual Basic 2010. Therefore, .NET Framework 4.0 should be installed before running this program. Concordantly, .NET Framework 4.0 is pre-installed in Windows 8 and upper operating system, but, on the contrary, it is not pre-installed in older operating system. There is something interesting that, if your system is Windows Server 2003, you have to install Windows Image Component before installing .NET Framework 4.0. Failure may occur if the component is not installed.

The driver is compiled by Windows Driver Kit 7.1.

English is used in the program, but its usage is not complicated. What you need to do is just inputting PID into text box, and then click on the button.
